

At stand 4129 at INDEX08 in Geneva, Micrex will be featuring:

**STRETCH NONWOVENS:**

Customers require nonwovens which will adapt, conform, adjust, and respond to the surroundings in which they are used. These traits -- broadly referred to as "stretch", are in fact a combination of several different characteristics such as elasticity, extension, conforming, expandability, cushioning, retention -- in one or two dimensions. Elongation, regain, time to regain, modulus, etc., define how a given web substrate will perform in an application.

*25 gsm polypropylene*

Micrex has many years of experience in developing commercial nonwoven stretch products. We have learned that the path from product concept to commercial success is complex without proper resources. At INDEX we will be showing a collection of nonwoven substrates demonstrating a range of stretch properties without expensive elastomers. For information visit <http://www.micrex.com/stretch.htm>

**SUSTAINABLE PACKAGING SOLUTIONS:**

Companies world-wide are rethinking exactly what sustainability means over the life-cycle of a product. Consumers view many of the packaging solutions utilized today as wasteful. Micrex will be showing a range of Microcreped papers, nonwovens and films for packaging applications. Made from recycled products or products which will recycle easily, the addition of Microcreping adds cushioning, stretch, and conformability to sheet substrates which here-to-for would have been unsuitable for packaging applications.

An operating Micrex®/Microcreper™ will also be on-site.

For an appointment in advance of the show, please contact us via telephone or email.
